

1. The IoT Reference Model proposed by the IoT World Forum includes layers such as Physical Devices and Controllers, Connectivity, Edge Computing, Data Accumulation, Data Abstraction, Application Layer, and _____. [Collaboration and Processes]

2. The three main communication protocols between IoT devices and the cloud are HTTP/HTTPS, MQTT, and _____. [CoAP (Constrained Application Protocol)]

1. Which of the following is NOT a core component of the IoT as described in the text? [B]

A) Physical Object (Controller, Sensor, and Actuators)

B) Artificial Intelligence Algorithms

C) Connectivity (Internet)

D) Controller

2. According to the IoT World Forum Reference Model, which layer deals with converting protocols, routing to higher-layer software, and implementing fast path logic for low latency decision-making? [C]

A) Data Accumulation

B) Connectivity

C) Edge Computing

D) Data Abstraction

1. Briefly explain the role of the Data Abstraction layer within the IoT World Forum Reference Model. (The Data Abstraction layer "makes sense" of the accumulated data. It gathers similar information from various IoT sensors, prioritizes critical traffic or alarms, and structures the data into appropriate schemas and flows for upstream processing.)

2. The IoT Reference Architecture specifies three main protocols for communication between devices and the cloud. Two of them are HTTP/HTTPS and CoAP. What is the third protocol? (MQTT 3.1/3.1.1)
