

1

Question: What is the primary objective of the project described in the abstract?

- A) To analyze audio inputs for various mental health conditions.
- B) To develop a text-based emotion and sentiment analysis system for depression prediction.
- C) To compare the performance of different machine learning models for sentiment analysis.
- D) To explore the use of multimodal data in mental health diagnostics.

Correct Answer: B

2

Question: Which deep learning models are used in this project's system?

- A) BERT and LSTM
- B) DistilBERT and BiLSTM
- C) RoBERTa and GRU
- D) ALBERT and RNN

Correct Answer: B

3

Question: What is the advantage of using DistilBERT over BERT in this specific application?

- A) DistilBERT provides higher accuracy than BERT.
- B) DistilBERT supports multimodal input data.
- C) DistilBERT is more computationally efficient.
- D) DistilBERT is better at capturing long-term dependencies.

Correct Answer: C

4

Question: What preprocessing techniques are used to prepare the text data for the model?

- A) Text cleaning, tokenization, padding, and truncation.
- B) Stemming, lemmatization, and part-of-speech tagging.

C) Named entity recognition and sentiment lexicon matching.

D) Data augmentation and synthetic data generation.

Correct Answer: A

5

Question: According to the results, which model achieved higher accuracy in the emotion and sentiment analysis tasks?

A) BiLSTM achieved higher accuracy.

B) Both models achieved the same accuracy.

C) DistilBERT achieved higher accuracy.

D) Neither model performed well in the analysis.

Correct Answer: C
